# Contents

<b>1</b>	<b>Introduction</b>	<b>6</b>
1.1	Particle Physics overview . . . . .	6
1.2	Modern colliders... . . . . .	9
1.2.1	The need for high energy collisions . . . . .	9
1.2.2	Collider basics . . . . .	10
1.2.3	The LEP collider . . . . .	12
1.2.4	Electron vs. Hadron machines . . . . .	13
1.2.5	The TeVatron . . . . .	14
1.2.6	The Large Hadron Collider . . . . .	14
1.3	...and detectors . . . . .	14
1.3.1	Some typical events . . . . .	15
1.3.2	Main detector system requirements . . . . .	18
1.3.3	Typical particle detector system . . . . .	20
1.4	Examples of high-energy physics events . . . . .	22
1.5	Relativistic kinematics . . . . .	24
<b>I</b>	<b>Detectors</b>	<b>27</b>
<b>2</b>	<b>Interaction of radiation with matter</b>	<b>28</b>
2.1	Interactions of heavy charged particles . . . . .	28
2.1.1	Ionization energy loss . . . . .	29
2.2	Interactions of electrons and positrons . . . . .	34
2.3	Interactions of photons . . . . .	36
2.3.1	Photoelectric effect . . . . .	37
2.3.2	Compton scattering . . . . .	39
2.3.3	Electron-positron pair production . . . . .	39
2.3.4	Linear attenuation coefficient . . . . .	40
2.4	Electron-photon showers . . . . .	42
2.4.1	The Simple Shower model . . . . .	43
2.5	Interactions of neutrons and other hadrons . . . . .	45
<b>3</b>	<b>Detectors for ionization, position and momentum measurement</b>	<b>48</b>
3.1	The ionization chamber . . . . .	48
3.2	The proportional counter . . . . .	49
3.3	Gaseous tracking devices . . . . .	53
3.3.1	Multi-Wire Proportional Chamber (MWPC) . . . . .	53
3.3.2	Drift Chamber . . . . .	55

3.3.3	Time Projection Chamber (TPC)	59
3.4	Semiconductor tracking devices	60
3.5	Momentum measurement	64
3.5.1	Solenoids	66
<b>4</b>	<b>Detectors for energy measurement: calorimeters</b>	<b>68</b>
4.1	Electromagnetic calorimeters	68
4.1.1	Energy resolution	70
4.2	Hadronic calorimeters	71
<b>II</b>	<b>Accelerators</b>	<b>73</b>
<b>5</b>	<b>Introduction</b>	<b>74</b>
5.1	Historical overview of accelerator development	74
5.1.1	Electrostatic accelerators	74
5.1.2	Linear Accelerator	75
5.1.3	Cyclotron	76
5.1.4	Synchrotron	78
5.2	Phase Stability	79
5.3	Electrons – Synchrotron radiation	81
5.4	Optics – Bending and Focusing	82
5.4.1	Bending – magnetic dipoles	83
5.4.2	Focusing – magnetic quadrupoles	84
5.5	Phase space diagram	86
5.6	Alternating gradient focusing	87
5.7	Transverse motion equations	88

# Preface

These notes are intended for the second year undergraduate course “Particle Detectors and Accelerators”. The course is an essential part of the “BSc in Physics with Particle Physics” and aims to introduce the basic principles underlying particle detection and the acceleration of particles to the very highest energies. The emphasis is almost exclusively on the tools for carrying out experiments in particle physics, rather than on any of the many other uses (medical, industrial, etc.) that particle accelerators and detectors can be put to.

There are many excellent books on the physics behind particle detection techniques and the physics of particle accelerators. I have relied heavily on those listed in the bibliography section to prepare this course. However, these books are in general aimed at a more advanced audience (typically fourth year MSci, or even postgraduate). In the present notes I have therefore attempted to gather together, from the many sources, a coherent overview of the material of this course. My hope is that this will be useful for the student.

This first draft of the notes is still incomplete, and is certainly going to have to expand and evolve considerably in the coming years. I welcome comments, suggestions and corrections.

Pedro Teixeira-Dias,  
April 2006.
