

Discussion Session Week 1

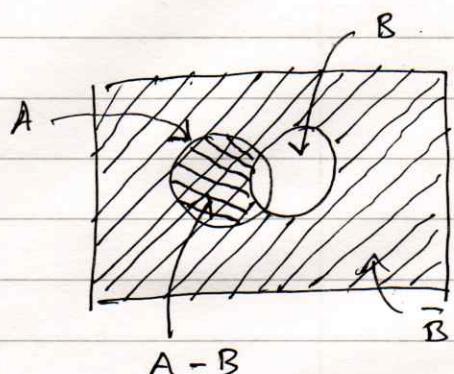

1) Example w/ Kolmogorov axioms:

$$\text{Show } P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

Recall

$$A - B \equiv A \cap \bar{B}$$

$$A \cup B = (A - A \cap B) \cup B$$

↑ ↗
disjoint

$$\Rightarrow P(A \cup B) = P(A - A \cap B) + P(B) \quad (1)$$

$$\text{also } A = (A - A \cap B) \cup A \cap B \quad (\text{disjoint})$$

$$\Rightarrow P(A) = P(A - A \cap B) + P(A \cap B) \quad (2)$$

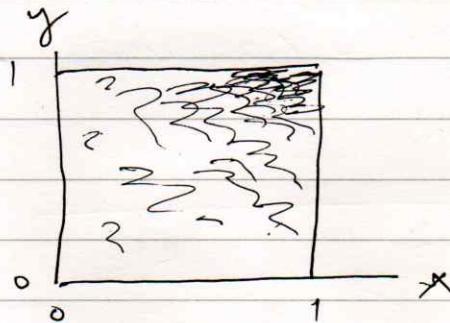

Use (1) + (2) to eliminate $P(A - A \cap B)$

$$\Rightarrow P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

2) Example w/ joint, marginal, conditional pdfs

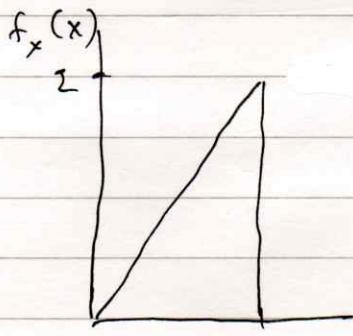

Consider $f(x, y) = 4xy$ $0 \leq x \leq 1$

$$0 \leq y \leq 1$$

- Marginal pdf $f_x(x) = \int_0^1 4xy dy$

$$= 2x, \quad 0 \leq x \leq 1$$

By symmetry,

$$f_y(y) = 2y, \quad 0 \leq y \leq 1$$

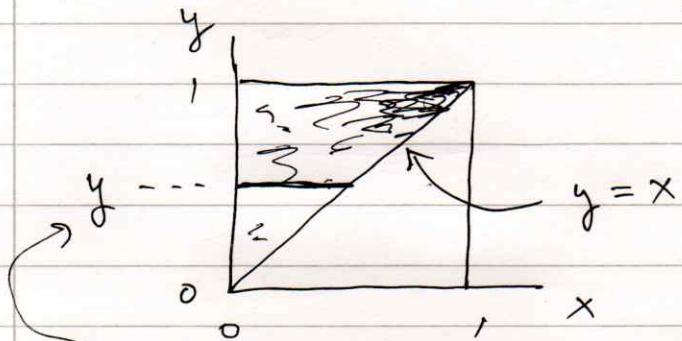

- Conditional pdf

$$f(x|y) = \frac{f(x,y)}{f_y(y)} = \frac{4xy}{2y}$$

$$= 2x, \quad 0 \leq x \leq 1$$

$\Rightarrow x + y$ independent ($f(x|y)$ indep. of y)

$$3) f(x,y) = \begin{cases} 8xy & 0 \leq x \leq 1 \\ & x \leq y \leq 1 \\ 0 & \text{otherwise} \end{cases}$$

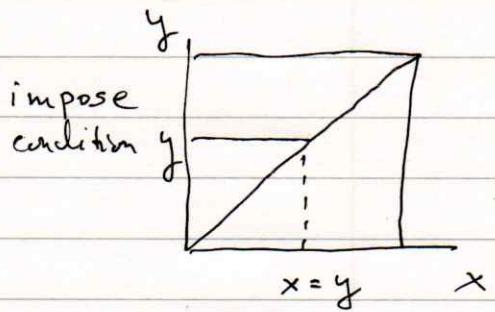

$$\begin{aligned} f_y(y) &= \int_{-\infty}^{\infty} f(x,y) dx = \int_0^y 8xy \, dx \\ &= 4y^3, \quad 0 \leq y \leq 1 \end{aligned}$$

$$\begin{aligned} f_x(x) &= \int_x^1 8xy \, dy = 4xy^2 \Big|_x^1 \\ &= 4x(1-x^2), \quad 0 \leq x \leq 1 \end{aligned}$$

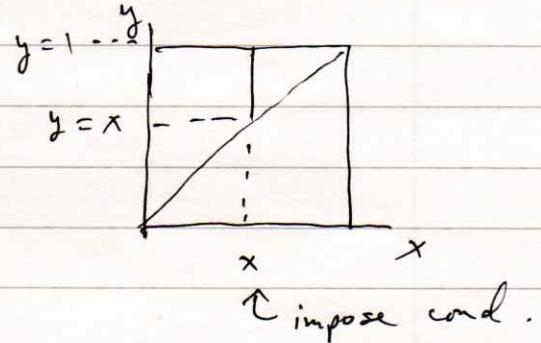

3 (continued) : conditional pdfs

$$f(x|y) = \frac{f(x,y)}{f_y(y)} = \frac{8xy}{4y^3} = \frac{2x}{y^2}, \quad 0 \leq x \leq y$$

$\neq f_x(x) \Rightarrow x + y \text{ not independent}$

$$f(y|x) = \frac{8xy}{4x(1-x^2)} = \frac{2y}{1-x^2}, \quad x \leq y \leq 1$$

Check Bayes' theorem

$$f(x|y) = ? \frac{f(y|x) f_x(x)}{f_y(y)}$$

$$\frac{2x}{y^2} = ? \frac{\frac{2y}{1-x^2} \cdot 4x(1-x^2)}{4y^3}$$

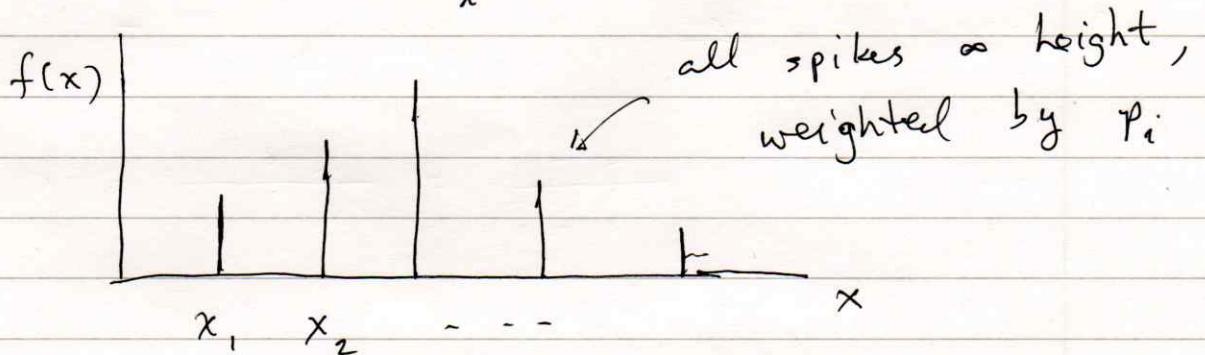

$$= \frac{2x}{y^2} \quad \checkmark$$

4) δ function \longleftrightarrow pdf / cdf

Suppose discrete r.v. $x_i, i=1, 2, \dots$

$$P(x_i) = p_i \quad (\text{prob. mass func.})$$

$$\Rightarrow \text{pdf} \quad f(x) = \sum_i p_i \delta(x - x_i)$$

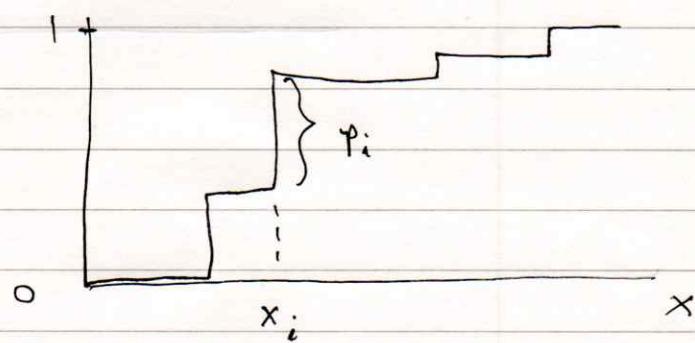

For cumulative dist., use

$$\int_a^b \delta(x - x_i) dx = \begin{cases} 1 & a < x_i < b \\ 0 & \text{otherwise} \end{cases}$$

$$\Rightarrow F(x) = \int_{-\infty}^x f(x') dx'$$

$$= \sum_i p_i \int_{-\infty}^x \delta(x' - x_i) dx'$$

$$= \sum_{\{i: x_i \leq x\}} p_i$$

5) Estimate # of false positives

$$\text{Given } \begin{cases} P(+ | D) = 0.90 \\ P(- | \bar{D}) = 0.93 \end{cases} \quad \begin{matrix} \text{has disease} \\ \text{doesn't have disease} \end{matrix} \quad \text{for some med test}$$

Out of a sample of $N = 1000$ individuals,

$$n_+ = 250 \text{ have + test result.}$$

Estimate # of false positives in sample

$$n_{+|\bar{D}} \approx P(+|\bar{D}) \cdot N_{\bar{D}} \quad \begin{matrix} \text{\# w/ no disease} \\ \text{in sample} \end{matrix}$$

$$P(+|\bar{D}) = 1 - P(-|\bar{D}) = 0.07$$

$$N_{\bar{D}} \approx N \pi_{\bar{D}} = N(1 - \pi_D) \quad \begin{matrix} \text{prior prob to have D} \end{matrix}$$

$$P(+) = P(+|D)\pi_D + P(+|\bar{D})\pi_{\bar{D}} \approx \frac{n_+}{N} \quad \begin{matrix} \text{\# of } (+) \\ \text{in sample} \end{matrix}$$

$$\Rightarrow \pi_D = \frac{P(+) - P(+|\bar{D})}{P(+|D) - P(+|\bar{D})}$$

$$\Rightarrow \pi_D \approx \frac{\frac{250}{1000} - 0.07}{0.90 - 0.07} = 0.22 \Rightarrow \pi_{\bar{D}} \approx 0.78$$

$$\Rightarrow n_{+|\bar{D}} = P(+|\bar{D}) N \pi_{\bar{D}} = 0.07 \times 1000 \times 0.78$$

of
false positives

$$= 54.6$$
