Statistical Data Analysis 2021/22 Lecture Week 1

London Postgraduate Lectures on Particle Physics University of London MSc/MSci course PH4515

Glen Cowan Physics Department Royal Holloway, University of London g.cowan@rhul.ac.uk www.pp.rhul.ac.uk/~cowan

Course web page via RHUL moodle (PH4515) and also www.pp.rhul.ac.uk/~cowan/stat_course.html

Statistical Data Analysis Lecture 1-1

- Course structure and policies
- Outline of topics
- Some resources

Course Info (1)

This year mixture of recordings, online and face-to-face:

Mondays 3-6 pm starting 4 Oct., no reading week.

First two hours are the primary lectures, 3rd hour is discussion session (additional examples, discussion of problem sheets, computing tools, etc.).

Lectures at RHUL in Tolansky 125 and live-streamed via MS Teams.

Lectures will be recorded; also last year's recordings available (and may be of better quality).

There will be 9 problem sheets.

Some paper & pencil, some computing problems.

Due weekly Mondays 5 pm starting lecture week 3 through 11.

Late submissions according to College policy (10% off for 24h, then no credit unless agreed).

G. Cowan / RHUL Physics

Course Info (2)

For problem sheets, scan/merge into a single pdf file.

Filename: YourName_stat_prob_sheet_n.pdf (n = 1,2,...)

Please no hi-res photos from phone (use iScanner or similar).

MSc/MSci students: upload on moodle.

PhD students: email single pdf attachment to g.cowan@rhul.ac.uk

Subject line: statistics problem sheet *n*

Put your name in the pdf file (not just in the email).

Also write on the problem sheet your College and degree programme (MSc, MSci, PhD).

For MSc/MSci students, written exam at end of year (May 2022); format (e.g., open/closed-book) will depend on covid situation.

Msc/Msci: Exam worth 80%, problem sheets 20%. For PhD students, no statistics exam.

G. Cowan / RHUL Physics

Statistical Data Analysis / lecture week 1

Computing

The coursework includes short computer programs.

Some choice of language – best to use python or C++ in a linux environment (some flexibility here).

The C++ option requires specific software (ROOT and its class library) – cannot just use e.g. visual C++

For PhD students, can use your own accounts – usual HEP setup should be OK.

For MSc/MSci students, you will get an account on the RHUL linux cluster. You create an X-Window on your local machine (e.g. laptop), and from there you remotely login to RHUL.

For mac, install XQuartz from www.xquartz.org and open a terminal window. For windows, various options, e.g., mobaXterm or cygwin/X (more info on web page).

Course Outline

- 1 Probability, Bayes' theorem
- 2 Random variables and probability densities
- 3 Expectation values, error propagation
- 4 Catalogue of pdfs
- 5 The Monte Carlo method
- 6 Statistical tests: general concepts
- 7 Test statistics, multivariate methods
- 8 Goodness-of-fit tests
- 9 Parameter estimation, maximum likelihood
- 10 More maximum likelihood
- 11 Method of least squares
- 12 Interval estimation, setting limits
- 13 Nuisance parameters, systematic uncertainties
- 14 Examples of Bayesian approach

Some statistics books, papers, etc.

Statistical Data Analysis Lecture 1-2

- Tasks of statistical data analysis in science
- The role of uncertainty
- Definition of probability

Theory ↔ Statistics ↔ Experiment

Theory (model, hypothesis):

Experiment (observation):

Some tasks of statistical data analysis

Compare data to predictions of competing models Most models contain adjustable parameters (e.g., particle physics: $G_{\rm F}$, $M_{\rm Z}$, $\alpha_{\rm s}$, $m_{\rm H}$,...)

Estimate (measure) the unknown parameters

Quantify uncertainty in parameter estimates

Test and quantify the extent to which the model is in agreement with the data.

Uncertainty

Uncertainty enters on several levels

Measurements not in general exactly reproducible

Quantum effects

Random effects (even without QM)

Model prediction uncertain

Approximations used to extract theoretical prediction

Modeling of apparatus

Quantify the uncertainty using **PROBABILITY**

A definition of probability

Consider a set S (the sample space)

Interpretation of elements left open, S could be e.g. set of outcomes of a repeatable observation.

Kolmogorov (1933)

Label subsets of S as A, B, ...

For all
$$A \subset S, P(A) \ge 0$$

 $P(S) = 1$
If $A \cap B = \emptyset, P(A \cup B) = P(A) + P(B)$

Properties of Probability

From the axioms of probability, further properties can be derived, e.g.,

$$P(\overline{A}) = 1 - P(A)$$

$$P(A \cup \overline{A}) = 1$$

$$P(\emptyset) = 0$$

if $A \subset B$, then $P(A) \le P(B)$

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

Conditional probability

Start with sample space S (e.g., set of outcomes), then restrict to a subset B (with $P(B) \neq 0$).

Define conditional probability of *A* given *B* (~4th axiom):

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

E.g. rolling die, outcome *n* = 1,2,...,6:

$$P(n \le 3|n \text{ even}) = \frac{P((n \le 3) \cap n \text{ even})}{P(n \text{ even})} = \frac{1/6}{3/6} = \frac{1}{3}$$

Independence

Subsets A, B independent if: $P(A \cap B) = P(A)P(B)$

If *A*, *B* independent,
$$P(A|B) = \frac{P(A)P(B)}{P(B)} = P(A)$$

I.e. if A, B, independent, imposing one has no effect on the probability of the other.

N.B. do not confuse with disjoint subsets, i.e., $A \cap B = \emptyset$

E.g. dice:
$$A = n$$
 even, $B = n$ odd, $A \cap B = \emptyset$
 $P(A) = \frac{1}{2}$
 $P(A|B) = 0$
Requiring B affects probability of A, so A, B not independent.

Statistical Data Analysis Lecture 1-3

- Interpretation of probability
- Bayes' theorem
- Law of total probability

Interpretation of Probability

I. Relative frequency $(\rightarrow$ "frequentist statistics") *A*, *B*, ... are outcomes of a repeatable experiment times outcome is *A*

$$P(A) = \lim_{n \to \infty} \frac{\text{times outcome is } A}{n}$$

II. Subjective probability $(\rightarrow$ "Bayesian statistics") A, B, ... are hypotheses (statements that are true or false)

P(A) = degree of belief that A is true

• Both interpretations consistent with Kolmogorov axioms.

• In particle physics frequency interpretation often most useful, but subjective probability can provide more natural treatment of non-repeatable phenomena: systematic uncertainties, probability that magnetic monopoles exist,...

Bayes' theorem

From the definition of conditional probability we have

$$P(A|B) = \frac{P(A \cap B)}{P(B)} \text{ and } P(B|A) = \frac{P(B \cap A)}{P(A)}$$

but $P(A \cap B) = P(B \cap A)$, so

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)}$$

Bayes' theorem

First published (posthumously) by the Reverend Thomas Bayes (1702–1761)

An essay towards solving a problem in the doctrine of chances, Philos. Trans. R. Soc. **53** (1763) 370

Bayes' theorem becomes

$$P(A|B) = \frac{P(B|A)P(A)}{\sum_{i} P(B|A_i)P(A_i)}$$

An example using Bayes' theorem

Suppose the probability (for anyone) to have a disease D is:

P(D)		0.001	← prior probabilities, i.e.,
$P(\text{no } \mathbf{D})$	=	0.999	before any test carried out

Consider a test for the disease: result is + or –

$P(+ \mathbf{D})$	=	0.98	 probabilities to (in)correctly
$P(- \mathbf{D})$	=	0.02	identify a person with the disease

$$P(+|\text{no D}) = 0.03$$
 \leftarrow probabilities to (in)correctly $P(-|\text{no D}) = 0.97$ identify a healthy person

Suppose your result is +. How worried should you be?

G. Cowan / RHUL Physics

Statistical Data Analysis / lecture week 1

Bayes' theorem example (cont.)

The probability to have the disease given a + result is

$$p(\mathbf{D}|+) = \frac{P(+|\mathbf{D})P(\mathbf{D})}{P(+|\mathbf{D})P(\mathbf{D}) + P(+|\mathrm{no} \mathbf{D})P(\mathrm{no} \mathbf{D})}$$

$= \frac{0.98 \times 0.001}{0.98 \times 0.001 + 0.03 \times 0.999}$

$$= 0.032 \leftarrow \text{posterior probability}$$

i.e. you're probably OK!

Your viewpoint: my degree of belief that I have the disease is 3.2%. Your doctor's viewpoint: 3.2% of people like this have the disease.

Frequentist Statistics – general philosophy

In frequentist statistics, probabilities are associated only with the data, i.e., outcomes of repeatable observations (shorthand: x).

Probability = limiting frequency

Probabilities such as

P (string theory is true), P (0.117 < α_s < 0.119), P (Biden wins in 2020),

etc. are either 0 or 1, but we don't know which.

The tools of frequentist statistics tell us what to expect, under the assumption of certain probabilities, about hypothetical repeated observations.

Preferred theories (models, hypotheses, ...) are those that predict a high probability for data "like" the data observed.

Bayesian Statistics – general philosophy

In Bayesian statistics, use subjective probability for hypotheses:

probability of the data assuming hypothesis H (the likelihood) $P(H|\vec{x}) = \frac{P(\vec{x}|H)\pi(H)}{\int P(\vec{x}|H)\pi(H) dH}$ posterior probability, i.e., after seeing the data $P(H|\vec{x}) = \frac{P(\vec{x}|H)\pi(H)}{\int P(\vec{x}|H)\pi(H) dH}$

Bayes' theorem has an "if-then" character: If your prior probabilities were $\pi(H)$, then it says how these probabilities should change in the light of the data.

No general prescription for priors (subjective!)

Statistical Data Analysis Lecture 1-4

- Random variables
- Probability (density) functions:
 - joint pdf
 - marginal pdf
 - conditional pdf

Random variables and probability density functions

A random variable is a numerical characteristic assigned to an element of the sample space; can be discrete or continuous.

Suppose outcome of experiment is continuous value x

$$P(x \text{ found in } [x, x + dx]) = f(x) dx$$

$$\rightarrow f(x) = \text{probability density function (pdf)}$$

$$\int_{a}^{b} f(x) dx = P(a \le x \le b)$$

$$\int_{-\infty}^{\infty} f(x) \, dx = 1 \qquad x \, \mathbf{1}$$

x must be somewhere

G. Cowan / RHUL Physics

Statistical Data Analysis / lecture week 1

Probability mass function

For discrete outcome x_i with e.g. i = 1, 2, ... we have

- $P(x_i) = p_i$ probability (mass) function
- $\sum_{i} P(x_i) = 1 \qquad x \text{ must take on one of its possible values}$

Cumulative distribution function

Probability to have outcome less than or equal to x is

Quantiles

Define quantile (α -point) x_{α} by $F(x_{\alpha}) = \alpha$ ($0 \le \alpha \le 1$)

i.e., quantile x_{α} is inverse of cumulative distribution: $x_{\alpha} = F^{-1}(\alpha)$, Special case of quantile: $x_{1/2}$ = median (compare to peak of pdf = mode)

G. Cowan / RHUL Physics

Statistical Data Analysis / lecture week 1

Histograms

Data sample $x = (x_1, ..., x_n)$, # events *n* could be very large.

 \rightarrow Histogram $N = (N_1, ..., N_M)$ M bins, bin size Δx .

pdf = histogram with infinite data sample, zero bin width, normalized to unit area.

$$f(x) = \frac{N(x)}{n\Delta x}$$

Often normalize histogram to unit area, compare directly to pdf.

Multivariate distributions, joint pdf

Outcome of experiment characterized by several values, e.g. an *n*-component vector, $(x_1, ..., x_n)$

$$P(A \cap B) = f(x, y) \, dx \, dy$$

$$\int \int dy$$
joint pdf

$$\int \cdots \int_{R} f(x_1, \dots, x_n) \, dx_1 \cdots dx_n = P(\mathbf{x} \in R)$$

Normalization:
$$\int \cdots \int f(x_1, \dots, x_n) dx_1 \cdots dx_n = 1$$

G. Cowan / RHUL Physics

r

r

Statistical Data Analysis / lecture week 1

Marginal pdf

Sometimes we want only pdf of some (or one) of the components:

$$P(A) = \sum_{i} P(A \cap B_{i})$$
$$= \sum_{i} f(x, y_{i}) dy dx$$
$$\rightarrow \int f(x, y) dy dx$$

 $f_x(x) = \int f(x,y) \, dy$ marginal pdf

E.g. to find marginal pdf of x_1 from *n*-dim. joint pdf, integrate over all variables except x_1 :

$$f_1(x_1) = \int \cdots \int f(x_1, \ldots, x_n) \, dx_2 \ldots dx_n$$

G. Cowan / RHUL Physics

Statistical Data Analysis / lecture week 1

Marginal pdf (2)

х

Marginal pdf is the projection of joint pdf onto individual axes.

Conditional pdf

Sometimes we want to consider some components of joint pdf as constant. Recall conditional probability:

$$P(B|A) = \frac{P(A \cap B)}{P(A)} = \frac{f(x, y) \, dx \, dy}{f_x(x) \, dx}$$

$$\rightarrow \text{ conditional pdfs:} \quad h(y|x) = \frac{f(x, y)}{f_x(x)}$$

$$g(x|y) = \frac{f(x,y)}{f_y(y)}$$

E.g.
$$h(y|x)$$
 is a pdf for y, here x is fixed.
The denominator fixes normalization so that $\int h(y|x) dy = 1$

G. Cowan / RHUL Physics

Conditional pdf (2)

E.g. joint pdf f(x,y) used to find conditional pdfs $h(y|x_1)$, $h(y|x_2)$:

Basically treat some of the r.v.s as constant, then divide the joint pdf by the marginal pdf of those variables being held constant so that what is left has correct normalization, e.g., $\int h(y|x) dy = 1$.

Bayes' theorem, independence for conditional pdf

Bayes' theorem becomes:
$$g(x|y) = \frac{h(y|x)f_x(x)}{f_y(y)}$$

Recall A, B independent if $P(A \cap B) = P(A)P(B)$.

 $\rightarrow x, y \text{ independent if } f(x,y) = f_x(x)f_y(y)$.

Then e.g. fixing *y* has no effect on pdf of *x*:

$$g(x|y) = \frac{f_x(x)f_y(y)}{f_y(y)} = f_x(x)$$
